

## **Our Relationship with the Environmental Protection Agency**

Salient CRGT has a long history of providing innovative and comprehensive software solutions to a variety of offices within the Environmental Protection Agency. Our experience in managing multiple concurrent task orders of a large BPA at the EPA has led to program offices working more closely together, collaborating with each other to leverage best practices and technical solutions across the agency. Salient CRGT's Oracle solutions have helped EPA in core mission areas such as widespread reduction of paper usage, faster and more efficient chemical studies, extensive emergency management collaboration and readiness, and higher-quality, more transparent insight into the agency's data. The following is a list of the current projects we are working on at the EPA, and a short description of the work we do:

**Office of Human Resources (OHR)** – We provide PMO support and Sharepoint development services for this organization. We follow Agile development methodologies and have been a trusted partner with OHR management for many years.

**Office of Emergency Management (OEM)** – We provide application production support/sustainment for several OEM applications, covering functional areas such as field readiness, oil database, equipment management, and site/data management. We have developed these web apps and are currently partnering with OEM management to convert some high-priority apps to field-ready mobile applications. In addition, we have provided some Data Analytics capabilities on top of some of these applications.

**Office of Chief Financial Officer (OCFO)** – We recently kicked off a project that assists the OCFO in requirements gathering and financial management strategy to accommodate a change to their financial system's accounting code structure. We will lead the effort in defining the conversion and integration requirements as well as gauging the impact of the changes to the existing interfaces and external systems.

### **Past Efforts**

OEI – TRI Reporting

OCFO – Update and Customization of Peoplesoft Payroll system

OCFO – Data Warehouse design and modernization

OW – Rapid development and support for New Horizons Oil Spill monitoring and reporting
